The Basic Installation on Reasonably Level Land:

1. Upon first receiving the Ooze Tube, it will come rolled on a wooden stake. To complete the installation you will need: a hammer, and source of water for filling
2. Before unrolling the Ooze Tube, remove all sharp objects from around the base of the tree.
3. Remove the two rubber bands and unroll the Ooze Tube.
4. Remove the bag of drip emitters stapled to the wooden stake and set it to the side.

5. With the fill and vent holes on the top side, wrap the Ooze Tube around the trunk the tree and align the two ends.
6. Join the two ends together and thread the wooden stake through the slots (just like belt loops)
7. Position the stake about 18 inches away from the trunk, on the uphill side of the tree.
8. Drive the stake in the ground using a hammer until it is firmly secured.
9. Begin filling the Ooze Tube with water and adjust as it expands to suit your fancy
Note: If you do not like the look of the stake sticking up, you can carefully drive it further into the ground to hide it.
10. Now, you can decide where to insert your drip emitters. You have a lot of water to work with and how you choose to use it is up to you. Instead of sending the drip emitters pre-installed, we know that trees and woody ornamentals come in all shapes and sizes. Some like a lot of water and some do not.
